## National Transportation Safety Board. 2004. U.S. Air Carrier Operations, Calendar Year 2000. Annual Review of Aircraft Accident Data NTSB/ARC-04/01. Washington, D.C.

Abstract: The National Transportation Safety Board's Annual Review of Aircraft Accident Data: U.S. Air Carrier Operations is a statistical review of U.S. commercial aviation accidents that occurred in calendar year 2000. In addition to accident statistics, the review provides general economic and aviation industry indicators that may have influenced aircraft activity during the year. Accident data for the 9 years preceding calendar year 2000 provide an historical context.

The National Transportation Safety Board is an independent Federal agency dedicated to promoting aviation, railroad, highway, marine, pipeline, and hazardous materials safety. Established in 1967, the agency is mandated by Congress through the Independent Safety Board Act of 1974 to investigate transportation accidents, determine the probable causes of the accidents, issue safety recommendations, study transportation safety issues, and evaluate the safety effectiveness of government agencies involved in transportation. The Safety Board makes public its actions and decisions through accident reports, safety studies, special investigation reports, safety recommendations, and statistical reviews.

Recent publications are available in their entirety on the Web at <a href="http://www.ntsb.gov">http://www.ntsb.gov</a>. Other information about available publications also may be obtained from the Web site or by contacting:

National Transportation Safety Board Public Inquiries Section, RE-51 490 L'Enfant Plaza, S.W. Washington, D.C. 20594 (800) 877-6799 or (202) 314-6551

Safety Board publications may be purchased, by individual copy or by subscription, from the National Technical Information Service. To purchase this publication, order report number PB2004-106609 from:

National Technical Information Service 5285 Port Royal Road Springfield, Virginia 22161 (800) 553-6847 or (703) 605-6000

The Independent Safety Board Act, as codified at 49 U.S.C. Section 1154(b), precludes the admission into evidence or use of Board reports related to an incident or accident in a civil action for damages resulting from a matter mentioned in the report.

## INTRODUCTION

#### PURPOSE OF THE ANNUAL REVIEW

The National Transportation Safety Board's Annual Review of Aircraft Accident Data: U.S. Air Carrier Operations is a statistical review of U.S. commercial aviation accidents that occurred in calendar year 2000. In addition to accident statistics, the review provides general economic and aviation industry indicators that may have influenced aircraft activity during the year. Accident data for the 9 years preceding calendar year 2000 provide an historical context.

#### WHICH AIRCRAFT ARE INCLUDED IN THIS REVIEW?

This review covers accidents involving aircraft operated by U.S. air carriers under Title 14,<sup>1</sup> Parts 121 and 135, of the Code of Federal Regulations (CFR). Air carriers are generally defined as operators that fly aircraft in revenue service. Part 121 operations must adhere to specific requirements that address routes, airports, aircraft maintenance, and crew performance. These requirements limit Part 121 operations to controlled airspace and to controlled airports that are characterized by specific weather, navigational, operational, and maintenance support. Part 135 operations must adhere to similar requirements (with some notable differences with respect to aircraft and airport characteristics and to crew training and experience). However, Part 135 operations are allowed to service routes to smaller airports that do not have the weather, communications, and navigational capabilities required of the larger airports serving Part 121 operations. This typically means that Part 121 applies to major airlines and cargo carriers that fly large transport-category aircraft while Part 135 applies to commercial air carriers flying smaller jet and turboprop aircraft commonly referred to as commuter airlines (that is, scheduled Part 135) and air taxis (that is, ondemand Part 135).

In March 1997, the regulations defining Part 121 operations changed to include scheduled aircraft with more than 10 seats. Previously, scheduled aircraft with fewer than 30 passenger seats were operated under Part 135. As a result, after 1997, most carriers that once were popularly known as "commuters" began operating as Part 121 flights.

In this review, data for scheduled and on-demand Part 135 operations are presented separately to reflect their distinctly different operating characteristics. According to 14 CFR Part 119.3, a *scheduled* operation is defined as any "passenger-carrying operation for compensation or hire conducted by an air carrier or commercial operator for which the certificate holder or its representative 1

<sup>&</sup>lt;sup>1</sup> Title 14 is also known as the Federal Aviation Regulations (FAR).

offers in advance the departure location, departure time, and arrival location." Scheduled Part 135 operations represent a small segment of scheduled air carrier operations and accounted for less than 2.0% of the total air carrier flight hours in 2000.

By contrast, an *on-demand* operation is defined as any operation for compensation or hire for which the departure location, departure time, and arrival location are negotiated with the customer. Customers can arrange to charter an entire aircraft or book a single seat on an air taxi. According to the Federal Aviation Administration (FAA), about 3,000 on-demand Part 135 operators fly about 2,500 airplanes and 500 helicopters.<sup>2</sup> Historically, on-demand Part 135 operations represent about half of the air carrier fleet and account for about 15% of total air carrier flight hours.

Its on-demand nature is the important characteristic of this type of operation. On-demand Part 135 operators offer charter or air taxi flights on a flexible schedule carrying passengers or cargo (and in some cases both) to a variety of airports that are not usually serviced by scheduled airlines.<sup>3</sup> An on-demand operation can serve corporate customers who need a flexible schedule but who do not wish to support their own corporate flight department.

Besides the regulatory differences, scheduled and on-demand Part 135 carriers differ operationally. For example, scheduled Part 135 carriers typically fly aircraft with single/twin turbine engines or single/twin piston engines, are more likely to fly short routes, and are concentrated for the most part in Alaska. By contrast, on-demand Part 135 operations vary widely, are evenly distributed throughout the United States, and include both short and long routes that serve the specific needs of charter and air taxi customers. On-demand Part 135 aircraft range from single-engine piston aircraft to large corporate jets that are typically smaller than those used in Part 121 operations.

<sup>&</sup>lt;sup>2</sup> Accurate data for on-demand Part 135 operators and aircraft are difficult to obtain. The figures cited in the Annual Review are from the U.S. Department of Transportation, FAA, Chartering an Aircraft: A Consumer Guide (Washington, DC: FAA Office of Public Affairs). The 2000 General Aviation and Air Taxi Activity (GAATA) Survey, however, shows a total of 4,000 air taxi and air tour aircraft (not separated into airplanes and helicopters) in Table GA 00 1-3.

<sup>&</sup>lt;sup>3</sup> FARs restrict on-demand Part 135 operations to passenger-carrying operations conducted as a public charter; scheduled passenger-carrying operations of less than five round trips per week on at least one route between two or more points according to the published flight schedules; and all-cargo operations conducted with airplanes having a payload capacity of 7,500 pounds or less, or with rotorcraft. A final rule change to the FARs effective November 17, 2003 (*Federal Register*, Vol. 68, No. 180, September 17, 2003, pp. 54520-54588), concerning fractional ownership programs (which heretofore operated under Part 91) may significantly affect on-demand Part 135 operations. The rule change may require some fractional ownership programs to operate as if they were certified as on-demand Part 135.

Unlike scheduled and on-demand Part 135 operations, the operating rules for scheduled and nonscheduled Part 121 operators are the same for the most part. In addition, although all Part 121 operations are required to report activity data on a regular basis, on-demand Part 135 operators are not, as explained in the *Historical Trends and Current Accident Data* section. Therefore, data for scheduled and nonscheduled Part 121 operations are discussed together while data for scheduled and on-demand Part 135 operations are discussed separately.

#### WHICH AIRCRAFT ARE NOT INCLUDED IN THIS REVIEW?

This review does not discuss aircraft operations that are not covered by 14 CFR Parts 121 and 135, including the following:

- · General aviation aircraft<sup>4</sup>
- Military aircraft
- · Foreign-operated aircraft
- · Certain public use aircraft
- Ultralight vehicles
- · Experimental aircraft
- · Commercial space launches

#### **O**RGANIZATION OF THE **ANNUAL REVIEW**

The 2000 Annual Review is organized as follows:

- an overview of the accidents in 2000 discussed within the context of previous years' accident trends and aviation activity;
- 10-year summaries for Part 121, scheduled Part 135, and on-demand Part 135 aircraft accidents addressing such factors as types of flight, levels of aircraft damage, and levels of human injury; and
- an in-depth analysis of accidents that occurred in 2000.

3

<sup>&</sup>lt;sup>4</sup> A separate review, published annually by the Safety Board, summarizes accident statistics for these aircraft.

Much of the information in the Annual Review is presented in graphs and tables. Readers who prefer to view tabular data or who want to manipulate the data used in the report may access the data set online at <u>www.ntsb.gov/aviation/Stats.htm</u>.

#### THE SAFETY BOARD'S INVESTIGATIVE PROCESS

The Safety Board investigates every civil aviation accident that occurs in the United States. It also provides investigators to serve as U.S. Accredited Representatives, as specified in international treaties and agreements, for aviation accidents that occur overseas and that involve aircraft registered in the U.S., aircraft operated by U.S. air carriers, or aircraft or major components of U.S. design or manufacture.<sup>5</sup> Investigations are conducted by Safety Board Headquarters staff based in Washington, D.C., or by staff based in one of the regional offices (see Appendix A).

Note that although the Safety Board investigates all civil aviation accidents that occur on U.S. soil (including those involving domestic and foreign operators), the *Annual Review* describes accidents that occur among U.S.-operated aircraft in all parts of the world.

#### THE SAFETY BOARD'S AVIATION ACCIDENT/INCIDENT DATABASE

The Safety Board maintains the Accident/Incident Database, the government's official repository of aviation accident data and causal factors for civil aviation accidents. The database was established in 1962 by the Safety Board's predecessor agency, the Civil Aeronautics Board, and about 2,000 new event records are added each year. The record for each aviation accident contains data about the aircraft, environment, injuries, sequence of accident events, and other topics. The database is available to the public at <<u>ftp://www.ntsb.gov/avdata/</u>>. A database query tool is also available at <u>www.ntsb.gov/ntsb/query.asp#query\_start</u> to search for sets of accidents using such information as date, location, and category of aircraft.

REVIEW

NNUAL

<sup>&</sup>lt;sup>5</sup> For more detailed information about the criteria for Safety Board investigation of an aviation accident or incident, see 49 CFR 831.2.

The Safety Board's database is primarily composed of aircraft accidents. An "accident" is defined in 49 CFR Part 830.2 as—

an occurrence associated with the operation of an aircraft which takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death<sup>6</sup> or serious injury,<sup>7</sup> or in which the aircraft receives substantial damage.<sup>8</sup>

The database also contains fields for documenting an aviation "incident," defined in 49 CFR Part 830.2 as "an occurrence other than an accident, associated with the operation of an aircraft, which affects or could affect the safety of operations."

During an investigation, Safety Board investigators collect information from a variety of sources, including the aircraft crew, the FAA, manufacturers, and witnesses. Investigators use the Board's Accident Data Management System (ADMS) to document those data in the Accident/Incident Database. The database contains five types of data:

- · factual information that documents the accident situation;
- occurrence codes to document *what* happened during the accident;
- phase-of-flight codes to designate when each occurrence took place;
- explanatory causes, factors, and findings to identify the causeand-effect relationships that help explain why the accident happened; and
- narrative data that describes the accident in natural language and states the probable cause of the accident.

5

<sup>&</sup>lt;sup>6</sup> "Fatal injury" means any injury that results in death within 30 days of the accident.

<sup>&</sup>lt;sup>7</sup> "Serious injury" means any injury that: (1) requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received; (2) results in a fracture of any bone (except simple fractures of fingers, toes, or nose); (3) causes severe hemorrhages, nerve, muscle, or tendon damage; (4) involves any internal organ; or (5) involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

<sup>&</sup>lt;sup>8</sup> "Substantial damage" means damage or failure that adversely affects the structural strength, performance, or flight characteristics of the aircraft, and that would normally require major repair or replacement of the affected component. None of the following is considered "substantial damage": engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairings or cowling, dented skin, small punctured holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wingtips.

Each type of data is briefly described below.

**Factual Information.** Investigators enter information into the database that describes the accident aircraft, crew and passengers, and accident environment. These data typically include aircraft type, make and model, aviation-related demography of flight and cabin crew, weather conditions, and accident site details, including wreckage information.

**Occurrence Data.** The circumstances of an accident are documented in the Safety Board's accident report as accident "occurrences" within a "sequence of events." As stated above, occurrence data indicate *what* happened during the accident. A total of 54 occurrence codes<sup>9</sup> are available to describe the events for any given accident. Because aviation accidents are rarely limited to a single event, each accident is coded as a sequence (that is, occurrence 1, occurrence 2, etc.), with as many as five different occurrence codes. For accidents that involve more than one aircraft, the list of occurrences may be unique to each aircraft.

Occurrence data do not include any information about why an accident may have happened; the first occurrence can instead be considered the first observable link in the accident chain of events. First occurrence data are used with phaseof-flight data to characterize the initiating event in an accident sequence.

**Phase-of-Flight Data.** Investigators use phase-of-flight codes to describe when an occurrence takes place in the chronology of accident events. These 50 distinct codes are classified into six major categories describing typical flight operations: takeoff or climb, approach or landing, maneuvering or hovering, cruise or descent, standing, and taxiing. Each category contains more specific detail about that phase of flight; for example, the category "standing" includes standing with engines operating, standing with engines not operating, and standing while starting engines.

**Findings, Factors, and Probable Cause Data.** In addition to coding accident occurrences and phase-of-flight data, the Safety Board determines probable cause. The objective of this determination is to discern the cause-and-effect relationships in the accident sequence. This could be described as *why* the accident happened. In determining probable cause, the Safety Board considers all facts, conditions, and circumstances associated with the accident. Within each accident occurrence, any information that contributes to the Board's determination of probable cause is identified as a "finding" and may be further designated as either a "cause" or "factor." The term "factor" is used to describe situations or circumstances that contribute to the accident cause. The details of probable cause are coded as the combination of all causes, factors, and findings

Two Thousand

associated with the accident. Just as accidents often include a series of events, several causes and factors can contribute to the reason why an accident occurred. For this reason, a single accident report can include multiple cause and factor codes. Hundreds of unique codes are available to document probable cause information. These codes have been grouped into three broad cause/factor categories: aircraft, environment, and personnel.

**Narrative Data.** Natural language textual descriptions corresponding to the factual and analytical information described above are also maintained in the database and can be retrieved with other specific information about the accident. The factual information in the narrative corresponds to the factual data that are encoded in the database. Similarly, the analytical portion of the narrative corresponds to the probable cause, occurrence codes, phase-of-flight codes, and causes, factors, and findings as encoded in the database.

Narrative data are entered into the database incrementally. Shortly after completing the on-scene investigation, investigators enter a preliminary factual report into the database. This preliminary report contains limited information about the accident or incident, such as date, location, aircraft operator, and type of aircraft. Once investigators have finished gathering and compiling information, they submit a factual report. After the investigation is complete, a final report is issued, which may include an analysis of the factual information, statement of probable cause and other contributing factors, and, if appropriate, a list of recommendations. For major accident investigations, the probable cause is approved by the five Members of the Safety Board; for general aviation accident investigations, approval authority may be delegated to the Director of Aviation Safety. Information about the accident and the investigation is available to the public after approval by the Safety Board or their designees. 7

## HISTORICAL TRENDS AND CURRENT ACCIDENT DATA

This section presents an overview of accident data for the years 1991 through 2000 as a context for considering year 2000 accident data in more detail. The discussion begins by focusing on key measures for determining aircraft flight activity and then discusses the number of accidents, accident rates, and broad causes and factors for each operational category over the 10-year period.

#### **AIRCRAFT FLIGHT ACTIVITY**

The 2000 Annual Review presents accident data in two ways: by the number of accidents and by accident rate. For Part 121 and scheduled Part 135 operations, accident rates are calculated using three flight activity measures: flight hours, departures, and miles flown. As mentioned previously, all Part 121 and scheduled Part 135 carriers are required by regulation to report revenue flight activity<sup>10</sup> data to the Department of Transportation,<sup>11</sup> while on-demand Part 135 carriers are not. As a result, accident data in the 2000 Annual Review—and the method used to calculate accident rates—differ depending on the type of operation.

Part 121 and scheduled Part 135 flight activity data, including flight hours, number of departures, and miles, are maintained by the Bureau of Transportation Statistics (BTS). These data are aggregated by the FAA's Systems Process Audit staff (AFS-40) to produce annual reports of flight activity. The flight activity measures are based on a full census of the active Part 121 and scheduled Part 135 fleet.

In contrast, flight activity data for Part 135 operations are estimated using the voluntary General Aviation and Air Taxi Activity Survey (GAATA Survey), which is compiled annually by the FAA. The GAATA Survey was established in 1978 to gather a sampling of information from owners of general aviation and ondemand Part 135 aircraft. The information includes flight hours, avionics, base location, and use, but it does not include miles flown or departures. To conduct the survey, the FAA selects registered aircraft from its Civil Aviation Registry using a stratification procedure based on aircraft type and geographic region. In 2000, on-demand Part 135 aircraft accounted for less than 2% of the fleet targeted by the GAATA Survey, and the overall survey response rate was only 52.5%.<sup>12</sup> Note that

Two Thousand

00

<sup>&</sup>lt;sup>10</sup> Activity data include revenue aircraft hours, revenue aircraft departures, revenue aircraft miles flown, and several others.

<sup>&</sup>lt;sup>11</sup> Part 121 operators report activity monthly using Traffic Reporting System Form 41, Schedules T-100 and T-100(f), and Scheduled Part 135 Operators report quarterly using BTS Form 298-C, Schedules A-1 and T-1.

<sup>&</sup>lt;sup>12</sup> There were 3,686 air taxis and 331 air tours in 2000 according to the GAATA Survey, Calendar Year 2000, Table 1.1, <a href="http://api.hg.faa.gov/Gasurvey/index.htm">http://api.hg.faa.gov/Gasurvey/index.htm</a>.

9

the small proportion of on-demand Part 135 aircraft in the survey, combined with low survey response rates, and the fact that the survey goes to aircraft owners rather than operators, results in an imprecise activity estimate.

Once the GAATA data are compiled, the FAA estimates flight hours, which the Safety Board includes in the annual reviews. Prior to 2002, the FAA estimated flight hours based strictly on survey data. In 2002, the FAA changed its estimation method and revised its flight-hour estimates for on-demand Part 135 operations for the years 1992-2000. The revised activity estimate uses calculations that are based on the number of aircraft assumed to operate on-demand operations (from the FAA's Vital Information Subsystem<sup>13</sup>), and the average number of flight hours reported on the GAATA Survey. As a result, FAA's flight-hour estimates for on-demand Part 135 flight operations are substantially higher than they would be using the previous method. For example, before the FAA changed its estimating method, the flight-hour estimate for 2000 would have been 2,430,000; using the revised method, it is 3,552,881, an estimate that is 46.2% higher. This change in estimated flight activity results in a consistently lower accident rate calculation for the years 1992-2000. The change is so dramatic that the Safety Board maintains on its Web site<sup>14</sup> a comparison of flight-hour estimates for each year using both estimating methods. The Annual Review uses the revised activity measures for on-demand Part 135 operations.

The only flight activity measure common to Part 121, scheduled Part 135, and on-demand Part 135 operations is flight hours. Although the number of departures is available for Part 121 and scheduled Part 135 operations, the flight-hourper-departure rates for those operations differ greatly. Accordingly, the 2000 Annual Review calculates accident rates for Part 121 and scheduled Part 135 operations using the number of flight hours and departures. The number of departures or miles flown is not available for on-demand Part 135 operations and cannot therefore be used to calculate rates for those operations.

Prior to the 1998 Annual Review, activity rates were presented in units of hundredthousands for flight hours and departures and in millions for miles flown. Because of an increase in activity and a decrease in accident numbers, and to facilitate interpretation of rate data, the Annual Review now presents aircraft activity data in units of millions for flight hours and departures and billions for miles flown; accident rates are calculated using flight hours and number of departures only.<sup>15</sup> Any comparisons with Safety Board data published before the 1998 Annual Review should account for this change.

<sup>&</sup>lt;sup>13</sup> The Vital Information Subsystem (VIS) is an FAA database used to track commercial and government operations certificates.

<sup>&</sup>lt;sup>14</sup> See table 9a at <u>www.ntsb.gov/aviation/Table9a.htm</u>.

<sup>&</sup>lt;sup>15</sup> From BTS, 2002 National Transportation Statistics (BTS-02-08): Table 2-9 for Part 121 Operations, Table 2-10 for Scheduled Part 135 Operations, and Table 2-13 for On-Demand Part 135 Operations.

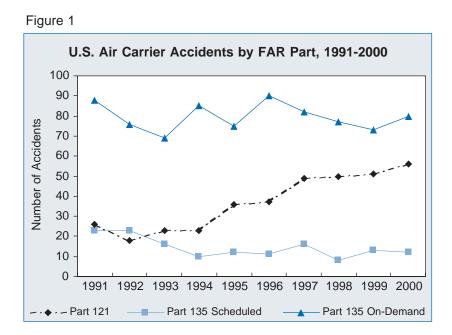

#### UNITED STATES COMMERCIAL AIRCRAFT ACCIDENTS, 1991 - 2000

In 2000, a total of 148 accidents occurred among U.S. air carriers. Of these, Part 121 operations accounted for 56 accidents, scheduled Part 135 operations for 12, and on-demand Part 135 operations for 80 (table 1). The accident rate (per million flight hours) in 2000 for Part 121 was the lowest of the three types of air carriers, with the scheduled Part 135 rate nearly 10 times greater than the rate for Part 121.

Table 1
---------

Accidents and Accident Rates for 2000				
	Number of Accidents	Accidents Per Million Flight Hours		
Part 121	56	3.06		
Scheduled Part 135	12	32.47		
On-Demand Part 135	80	22.50		

Historically, the number of Part 121 accidents steadily increased from 1994 through 2000 while the number of scheduled and on-demand Part 135 accidents decreased overall (figure 1). Part of the increase in Part 121 accidents in 1997 was due to the reclassification of some scheduled Part 135 operations to Part 121 in that year, as previously discussed. As a group, however, Part 135 operations accounted for consistently more accidents than did Part 121.

Two Thousand

Although the number of accidents increased, the accident rate for Part 121 accidents remained relatively constant from 1991 through 2000 (figure 2). However, rates for scheduled Part 135 operations increased substantially between 1996 and 1997, due to the Part 121/135 reclassification. Continued increases

AUN

7

in the scheduled Part 135 accident rate after 1997 appear to be due to a relatively constant number of accidents per year associated with a corresponding decline in flight hours for that air carrier segment. The data show that the reclassification did not adversely affect the accident rate for Part 121 operations. On-demand Part 135 accident rates decreased overall after 1994 although the rate remained relatively constant for the years 1998, 1999, and 2000.

As shown in figure 3, accident rate calculations were affected by different activity measures although the pattern that emerged was generally the same regardless of which measure was used. After the Part 121/135 reclassification in 1997, the rates per million flight hours and per million departures diverged notably, with scheduled Part 135 rates increasing while Part 121 rates remained relatively constant. However, the divergence was larger when flight hours were used to calculate the rates, possibly because the aircraft remaining in Part 135 after the reclassification flew shorter trips than those that were moved to Part 121. Accident rates for the Part 121 group did not show a similar change after the reclassification.

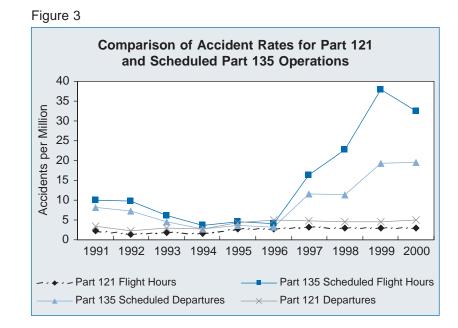

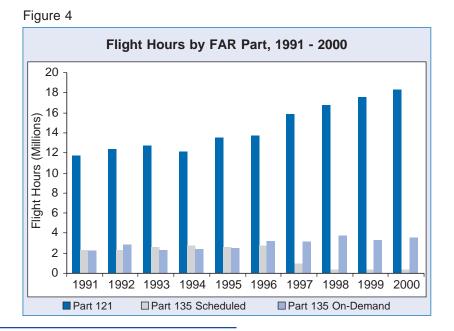

Figure 4 compares flight hours for Part 121, scheduled Part 135, and ondemand Part 135 operations; figures 5 and 6 compare data for departures and miles flown for Part 121 and scheduled Part 135 operations.<sup>16</sup> All Part 121 aviation activity indicators increased over the 10-year period, with a record number of flight hours, departures, and miles flown in 2000. The notable increases for Part 121 operations that began in 1997 can most likely be attributed to the Part 121/135 reclassification. Similarly, all activity indicators for scheduled Part 135 aircraft decreased substantially after 1996 and remained relatively constant from 1998 through 2000.

<sup>16</sup> As previously mentioned, estimated flight hours are the only flight activity measure available for on-demand Part 135 operations. These estimates are based on GAATA Survey data. Note that the FAA's 2002 change in estimating method significantly increased flight hour estimates for on-demand Part 135 operations for the years 1992 – 2000. The flight hours reported in this annual review for on-demand Part 135 operations are based on the revised estimates.

## PART 121 OPERATIONS: 10-YEAR SUMMARY

#### SAFETY BOARD SEVERITY CLASSIFICATION OF PART 121 ACCIDENTS

Since 1997, the Safety Board has used a classification system for Part 121 and other air carrier accidents based on accident severity. Developed in response to a congressional requirement,<sup>17</sup> the system uses classifications that characterize both injury and damage.

#### DEFINITIONS OF SAFETY BOARD SEVERITY CLASSIFICATIONS FOR PART 121 ACCIDENTS

**Major** - an accident in which any of three conditions is met:

- Part 121 aircraft was destroyed, or
- there were multiple fatalities, or
- there was one fatality and a Part 121 aircraft was substantially damaged.

Serious - an accident in which at least one of two conditions is met:

- there was one fatality without substantial damage to a Part 121 aircraft, or
- there was at least one serious injury and a Part 121 aircraft was substantially damaged.

**Injury** - a nonfatal accident with at least one serious injury and without substantial damage to a Part 121 aircraft.

**Damage** - an accident in which no person was killed or seriously injured, but in which any aircraft was substantially damaged.

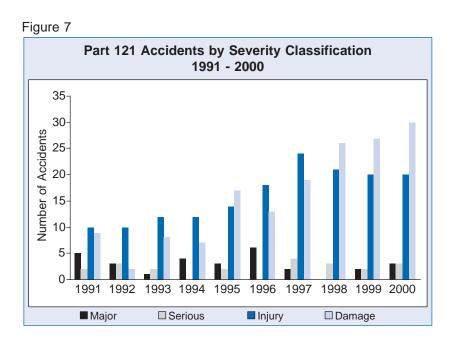

<sup>&</sup>lt;sup>17</sup>The classification system was introduced in 1997 as a requirement of the FAA Reauthorization Act of 1996 (and put into effect by Public Law 104-264, Sec. 407; amendment to *United States* Code Title 49, Subtitle II, Chapter 11, Section 1119) for the Safety Board to provide "clearer descriptions of accidents associated with air transportation, including a more refined classification of accidents which involve fatalities, injuries, or substantial damage and which are only related to the operation of an aircraft." Prior to 1997, the severity of an accident was characterized either in terms of injuries (fatal, serious, minor, or none) or aircraft damage (destroyed, substantial, minor, or none).

#### PART 121 ACCIDENTS BY SEVERITY CLASSIFICATION

Figure 7 shows the number of Part 121 accidents by severity classification, and figures 8 and 9 show the accident rate by severity classification, calculated using flight hours (figure 8) and departures (figure 9). In 2000, 57 aircraft were involved in 56 Part 121 accidents,<sup>18</sup> and the accident rate was 3.06 accidents per million flight hours. From 1991 to 2000, both the number and rate of Part 121 accidents increased overall; the number of accidents about doubled, and the rates increased by about half. In addition, the number of Part 121 accidents increased markedly in 1997, in part due to the Part 121/135 reclassification that year. Since 1982, all of the aircraft involved in Part 121 accidents have been airplanes.

The number of major and serious accidents and the rates of those accidents remained relatively constant from 1997 to 2000. Much of the increase in the number of accidents and overall accident rates that did occur was caused by increases in the number of lower severity (i.e., lower injury-level and lower damage-level) accidents, as shown in figure 7.

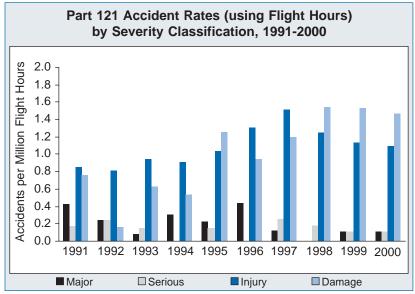

Two Thousand

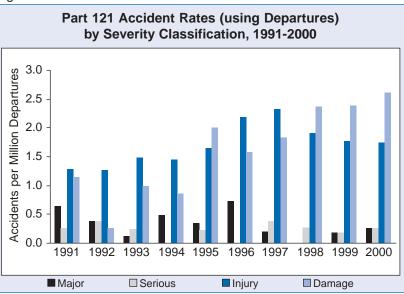

<sup>18</sup>A collision between aircraft is counted as one accident in this review. One such collision between two Part 121 aircraft occurred in 2000.

#### Figure 8

The number of people injured annually in Part 121 accidents can be dramatically affected by a few major accidents in a given year. For instance, figure 10 shows that a large number of fatalities (787 total) occurred in 1994, 1995, and 1996; almost all of these (700) can be attributed to 5 of the 96 accidents that occurred during those years.<sup>19</sup> In general, however, the proportion of people injured in

Two Thousand

 $\triangleleft$ 

<sup>&</sup>lt;sup>19</sup>The five accidents were USAir Flight 427 on September 8, 1994, resulting in 132 fatalities; American Eagle Flight 4184 on October 31, 1994, resulting in 68 fatalities; American Airlines Flight 965 on December 20, 1995, resulting in 160 fatalities; ValuJet Flight 592 on May 11, 1996, resulting in 110 fatalities; and TWA Flight 800 on July 17, 1996, resulting in 230 fatalities.

Part 121 accidents during the 10-year period was small.<sup>20</sup> Of the more than 629 million passengers who boarded Part 121 flights at United States airports in 2000, less than 1 in 133,000 passengers was involved in an accident. Of the 4,165 passengers who were aboard accident aircraft, only 169 sustained injuries; 83 of those injuries were fatal, 9 were serious, and 77 were minor.<sup>21</sup> Although more injuries occurred in 2000 than in 1999, the number was smaller than in preceding years.

As might be expected, most of the fatal accidents from 1991 through 2000 occurred when the aircraft was destroyed (table 2). Note, however, that fatalities sometimes occurred even when damage to the aircraft was minor or nonexistent. This was also the case for serious injuries, where 87% of the accidents resulting in serious injuries were accidents that caused either minor or no damage to the aircraft (table 3). However, the survivability of more serious accidents can be quite good; 83% of the accidents producing minor injuries and 93% of the accidents resulting in no injuries were associated with substantially damaged aircraft (tables 4 and 5). The number of accidents where the aircraft was substantially damaged but the accident resulted in no injuries increased after 1994.

#### PROBABLE CAUSES, FACTORS, AND THE BROAD CAUSE/FACTOR CLASSIFICATION

Occurrence codes are used to describe what happened during an accident and the sequence in which those events occurred, and first occurrence data are used with phase-of-flight data to describe the initiating event in an accident sequence. Investigators use these occurrence codes and phase-of-flight data to establish a sequence of findings that are the basis for accident causes and factors. When two or more causes/ factors are identified for an accident, no attempt is made to identify one as the primary cause. Consequently, one accident could be assigned codes representing all three cause/factor groups. For this reason, the percentages of causes/factors in a given set of accidents can amount to more than 100%, as shown in figure 11.

As discussed previously, the cause/factor classification codes that investigators assign to an accident fall into three broad groups—aircraft, environment, and personnel. Historically, the personnel category has been cited in more Part 121 accidents than either aircraft or environment. From 1991 to 2000 (as shown in figure 11), personnel causes and factors were typically cited in 60% to 80% of the accidents in a given year. Environmental causes/factors (such as an in-flight encounter with weather) were next, followed by aircraft-related causes/factors (such as total loss of aircraft power due to a mechanical failure). In 52 of the 56 Part 121 accidents that occurred in 2000 where cause/factor information was available,<sup>22</sup> the causes and factors were consistent with this historical trend: personnel-related causes/factors were cited in 72% of accidents, environmental causes/factors in 46%, and aircraft-related causes/factors in 24%.

<sup>22</sup> The four accidents for which cause/factor information was not available occurred outside the United States. The Safety Board did not lead these foreign investigations, and data on the causes/factors, occurrences, phases of flight, and sequence of events were not documented in these cases.

# Scheduled Part 135 Operations: 10-Year Summary

#### SAFETY BOARD SEVERITY CLASSIFICATION OF SCHEDULED PART 135 ACCIDENTS

Like Part 121 accidents, Part 135 accidents (both scheduled and on-demand) are classified by highest level of injury (fatal, serious, minor, or none) and level of aircraft damage (destroyed, substantial, minor, or none).

#### **DEFINITIONS OF HIGHEST LEVEL OF INJURY**

**Fatal** - Any injury that results in death within 30 days of the accident. **Serious** - Any injury which: (1) requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received; (2) results in a fracture of any bone (except simple fractures of fingers, toes, or nose); (3) causes severe hemorrhages, nerve, muscle, or tendon damage; (4) involves any internal organ; or (5) involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

**Minor** - Any injury that is neither fatal nor serious. **None** - No injury.

#### DEFINITIONS OF LEVEL OF AIRCRAFT DAMAGE

**Destroyed** - Damage due to impact, fire, or in-flight failures to an extent not economically repairable.

**Substantial** - Damage or failure which adversely affects the structural strength, performance, or flight characteristics of the aircraft, and which would normally require major repair or replacement of the affected component. Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairings or cowling, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wingtips are not considered "substantial damage" for the purpose of this part.<sup>23</sup>

**Minor** - Any damage that neither destroys the aircraft nor causes substantial damage.

None - No damage.

#### SCHEDULED PART 135 ACCIDENTS BY SEVERITY CLASSIFICATION

The number of scheduled Part 135 accidents remained relatively constant from 1995 through 2000, averaging about 12 accidents per year. After 1991, only four of the accidents involved helicopters. In 2000, 12 scheduled Part 135 aircraft (all airplanes) were involved in accidents.

<sup>&</sup>lt;sup>23</sup> See 49 CFR 830.2.

The number of flight hours and departures for scheduled Part 135 operations (as shown in figures 4 and 5) decreased sharply in 1997 after the Part 121/135 reclassification when larger aircraft flown by more established operators were included in Part 121 operations. As a result, 1997 flight hours for scheduled Part 135 operations were less than half the 1996 totals; by 2000, flight hours and departures were less than a fifth of 1996 totals. However, as stated above, the number of accidents remained relatively constant and did not decrease as might be expected with the decline in flight activity (figure 12). Accordingly, rates for accidents with no injury, as shown in figures 13 and 14, increased between 1997 and 2000. Drawing firm conclusions about the cause of these trends is difficult given the small number of scheduled Part 135 accidents each year.

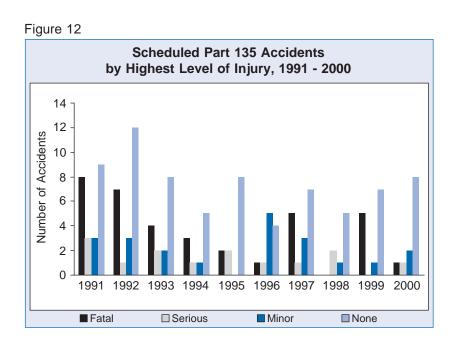

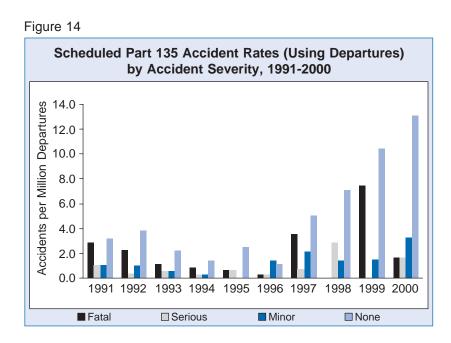

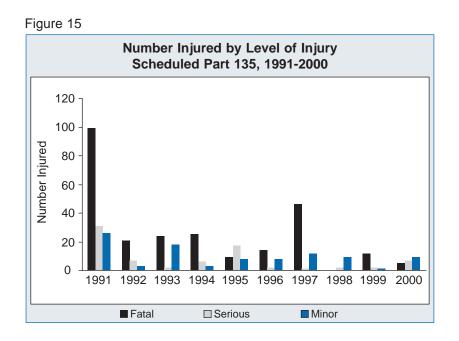

Figure 13

Scheduled Part 135 Accident Rates (Using Flight Hours) by Highest Level of Injury, 1991-2000 25.0 Accidents per Million Flight Hours 20.0 15.0 10.0 5.0 0.0 1994 1996 1997 1998 1999 2000 199 1992 1993 1995 Fatal □ Serious Minor None None

DATA CCIDENT  $\overline{\triangleleft}$ CRAFT Ř  $\overline{\triangleleft}$ ц. C REVIEW NNUAL

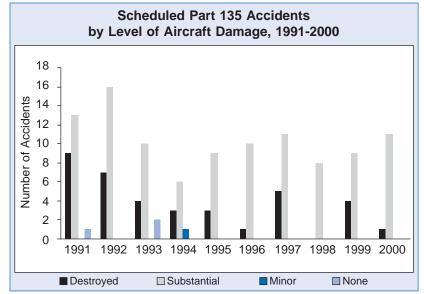

Unlike Part 121 accidents, a relatively large proportion of the people who boarded scheduled Part 135 accident flights in 2000 were injured: 21 out of 53. Of these, five injuries were fatal, seven serious, and nine minor (figure 15).

Most scheduled Part 135 aircraft involved in accidents from 1991 to 2000 were either substantially damaged or destroyed, as shown in figure 16. Calendar year 2000 was consistent with that trend; of the 12 aircraft involved in scheduled Part 135 accidents in 2000, 11 were substantially damaged and 1 was destroyed. 23

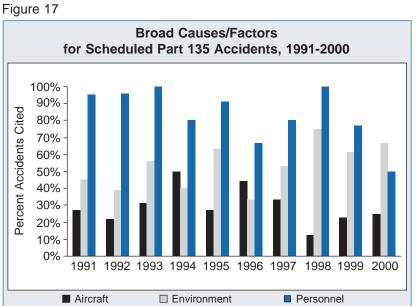

#### PROBABLE CAUSES, FACTORS, AND THE BROAD CAUSE/FACTOR CLASSIFICATION

Historically, the cause/factor category most often cited for scheduled Part 135 accidents is personnel, followed by the environment and aircraft, in that order (figure 17). This trend is consistent with Part 121 accidents. However, 2000 was a notable exception to this overall trend with the environment cited in two-thirds of the accidents, personnel in only half, and aircraft in a quarter. Note that the proportions attributed to each category can vary considerably from year to year (due most likely to the small number of scheduled Part 135 accidents that occur each year). As with Part 121 accidents, more than one broad cause/factor category can be assigned to a single scheduled Part 135 accident, and the percentages of causes and factors can total to more than 100%.

# ON-DEMAND PART 135 OPERATIONS: 10-YEAR SUMMARY

#### SAFETY BOARD SEVERITY CLASSIFICATION OF ON-DEMAND PART 135 ACCIDENTS

On-demand Part 135 operations are classified using the same definitions as those used for scheduled Part 135 operations.

#### **ON-DEMAND PART 135 ACCIDENTS BY SEVERITY CLASSIFICATION**

On-demand Part 135 operations typically account for half of the air carrier fleet and about 15% of total air carrier flight activity (that is, flight hours and miles flown). The term "on-demand operations" refers to revenue-earning flights for which departure time, departure location, and arrival location are specifically negotiated with the customer or the customer's representative. Helicopters represent a significant portion of the on-demand Part 135 fleet (about 12% in 2000) and on average account for about 20% of the on-demand Part 135 accidents.<sup>24</sup> A total of 80 aircraft (63 airplanes and 17 helicopters) were involved in on-demand Part 135 accidents in 2000.

The number of on-demand Part 135 accidents involving airplanes declined from 1996 through 1999,<sup>25</sup> but rose by 9% in 2000 (as shown in figure 18). The number of fatal on-demand Part 135 accidents for airplanes reached historic lows from 1997 through 1999, but the substantial increase in the number of fatal accidents in 2000 (especially those involving airplanes) brought fatalities more in line with data from previous years (as shown in figure 19). Each year, the number of on-demand Part 135 helicopter accidents consistently ranged from 10 to 20 accidents, accounting for fewer than 5 fatalities annually.

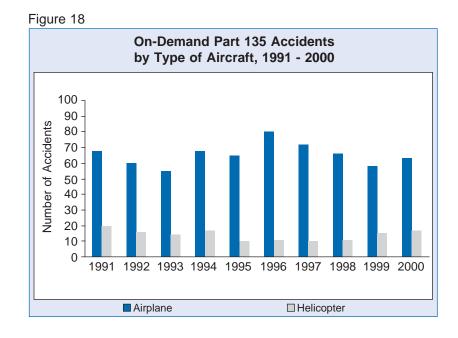

25

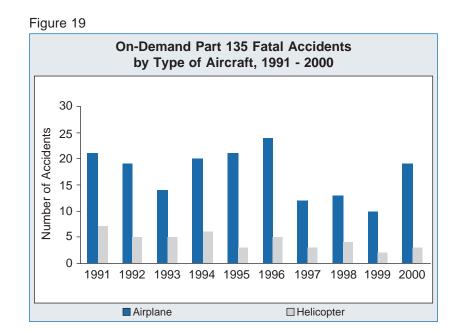

Two Thousand

<sup>25</sup> The definitions for level of injury and level of damage that apply to scheduled Part 135 operations also apply to on-demand Part 135 operations.

<sup>&</sup>lt;sup>24</sup> Results are shown separately for airplanes and helicopters when data are available.

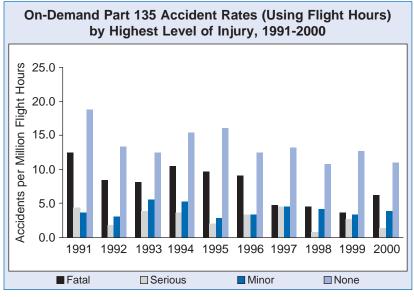

In keeping with the increase in fatal accidents involving airplanes in 2000, the fatal accident rate for on-demand Part 135 operations doubled from 1999 to 2000 (figure 20). Historically, 30% to 40% of the people aboard on-demand Part 135 accident aircraft are injured; the increase in fatal airplane accidents in 2000 pushed that proportion to more than half of those on board. Rates for all other types of accidents (serious, minor, none) declined for the most part, especially after 1994. This decline in rate was partly due to the FAA's 2002 revision of its method for estimating on-demand Part 135 flight hours.

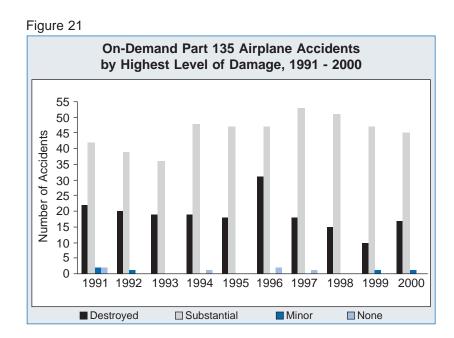

DATA ACCIDENT CRAFT Ř  $\overline{\triangleleft}$ ц. C REVIEW NNUAL  $\triangleleft$ 

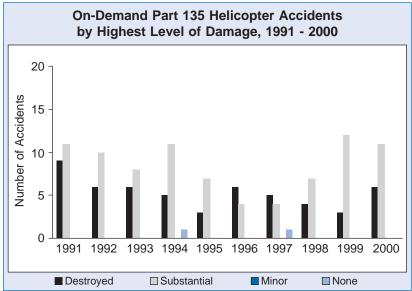

Most on-demand Part 135 accident aircraft were either substantially damaged or destroyed, as shown in figures 21 and 22 for airplanes and helicopters, respectively. Year 2000 accident data were consistent with this trend; of the 63 airplanes involved in on-demand Part 135 accidents, 17 were destroyed, 45 had substantial damage, and 1 sustained minor damage. In 2000, 6 helicopters were destroyed, and 11 were substantially damaged.

27

#### PROBABLE CAUSES, FACTORS, AND THE BROAD CAUSE/FACTOR CLASSIFICATION

The distribution of accident causes/factors for on-demand Part 135 accidents in 2000 was consistent with previous years, as shown in figure 23: personnel were cited in the most accidents, followed by the environment and aircraft, in that order. In 2000, cause/factor information was available for all 80 accidents involving on-demand Part 135 operations. Aircraft-related causes/factors were cited in 37.7% of accidents, environment in 61.0%, and personnel in 89.6%.

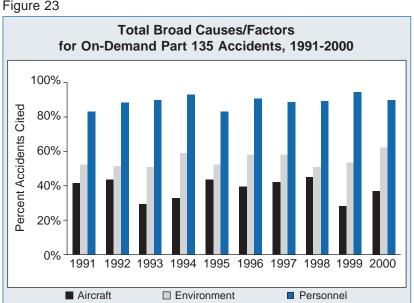

Figure 23

## Focus on 2000

Unlike the 10-year summaries, which describe accident trends, this section focuses on accident data specific to calendar year 2000. This section also provides a more in-depth analysis of the factors that characterize Part 121 and Part 135 accidents. The discussion begins by addressing the socioeconomic factors that affected commercial aviation in 2000.

#### GENERAL UNITED STATES SOCIAL, ECONOMIC, AND AVIATION INDICATORS

A number of indicators characterize the general economic, travel, and aviation environment for U.S. commercial aviation in 2000 (table 6). For instance, the U.S. population increased 13.1% between 1990 and 2000, and the gross domestic product rose 37.5% during that decade. In 2000, the median household income was \$43,162,<sup>26</sup> and consumers spent a record \$36.7 billion on airline travel (up 12.2% from 1999).<sup>27</sup>

Although the number of major air carriers did not change greatly between 1990 and 2000, ranging from 11 in 1995 to 15 in 2000, the number of other carriers (including national, large regional, and medium regional) increased 35.7%.<sup>28</sup> The number of air carrier aircraft in the fleet increased 35% from 1990 to 1999 to a peak of 8,228 aircraft; however, the removal of 293 aircraft from service in 2000 reduced the fleet by 3.6%. Between 1990 and 2000, air carrier passenger miles increased 49.2%, and the average number of miles flown per aircraft increased 12.8%. Similarly, per-passenger-mile revenues for domestic scheduled air carriers increased steadily over the last two decades, with a record average high of 14.6 cents per mile in 2000.

<sup>h</sup> BTS, 2002 National Transportation Statistics (BTS-02-08), Table 3-16.

The number of enplanements is another indicator of the aviation environment. In 2000, 629 million passengers boarded airplanes at U.S. airports. Figure 24 lists the number of enplanements at the top 20 airports in the United States in

2000.<sup>29</sup> As in previous years, Hartsfield Atlanta International Airport had the highest traffic volume with 39.4 million enplanements.

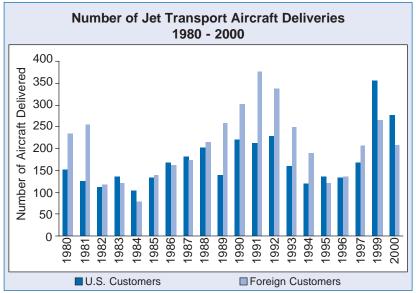

The number of jet transport aircraft deliveries also increased overall from 1980 to 2000 although the trend was cyclical (see figure 25); deliveries both to U.S. and foreign customers peaked in 1980, 1991, and 1999.<sup>30</sup> An average 46.2% of all deliveries went to U.S. customers from 1980 through 2000, with a low of 33.0% in 1981 and a high of 57.4% in 1999. After a record 620 total shipments in 1999, the number was down 135 aircraft in 2000, signaling a 22.5% decrease to U.S. customers (276 total aircraft) and a 20.8% decrease to foreign customers (209 total aircraft).

<sup>&</sup>lt;sup>29</sup> BTS, 2000 National Transportation Statistics (BTS-01-01), Table 1-36.

<sup>&</sup>lt;sup>30</sup> Includes 707, 737, 747, 757, 767, 777, MD-11, MD-80, MD-90, MD-95, DC-8, DC-9, DC-10, and L-1011. From Aerospace Industries Association www.aia-aerospace.org/stats/aero\_stats/stat21.pdf.

The total number of U.S. air carrier aircraft in operation peaked in 1999 and declined 3.6% in 2000 (table 7). The greatest decline was for fixed-wing turboprops (down 16.8%) and helicopters (down 69.7%). The number of fixed-wing turbojets in the 2000 fleet increased by 3.4%, primarily due to the addition of 269 two-engine turbojets, offsetting the loss of 78 three-engine turbojets.<sup>31</sup>

Active Air Carrier Aircraft by Type of Aircraft, 1991 - 2000

#### PART 121 ACCIDENTS IN 2000

This section provides more details about the Part 121 accidents that occurred in 2000. As discussed previously, Part 121 operations apply to major U.S. airlines and cargo carriers that fly large transport-category aircraft. In 2000, Part 121 operations carried more than 629 million passengers, more than 12.6 million tons of freight, and 2.3 million tons of mail. A total of 56 accidents occurred among such operations in 2000, resulting in 92 fatalities, 27 serious injuries, and 104 minor injuries.

Of the 4,165 passengers involved in Part 121 accidents, only 4% received any type of injury, and of the 130 flight crewmembers involved, only 6% sustained injuries. As a group, cabin crewmembers suffered the greatest proportion of injuries; of 185 cabin crew involved, 23.2% sustained injuries (table 8).

Table 8							
Part 121 Injuries by Role in 2000							
	Fatal	Serious	Minor	None	Total		
Flight Crew	5		3	122	130		
Cabin Crew	4	15	24	142	185		
Other Crew				6	6		
Passengers	83	9	77	3,996	4,165		
Total Aboard	92	24	104	4,266	4,486		
On Ground		3			3		
Total	92	27	104	4,257	4,490		
Accidents	3	22	6	25	6		

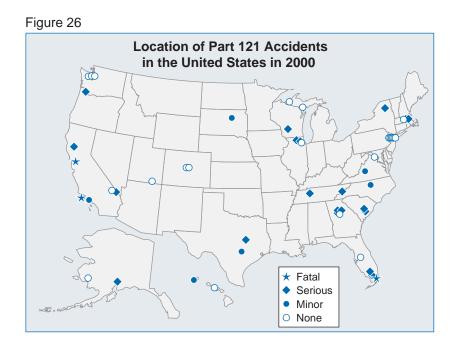

All 92 fatalities resulting from Part 121 accidents in 2000 resulted from three accidents:

- On January 31, 88 people were fatally injured when a McDonnell Douglas MD-83 crashed into the Pacific Ocean near Anacapa Island, California, as the result of a flight control system failure and subsequent loss of control.
- On February 16, 3 people were fatally injured when a McDonnell Douglas DC-8-71F crashed during takeoff in Rancho Cordova, California.

33

On November 20, 1 flight attendant received fatal injuries during an emergency evacuation in Miami, Florida, when an Airbus Industrie A300B4-605R failed to depressurize after landing.

Of the 56 Part 121 accidents that occurred in 2000, 51 occurred in the United States and its territories, 4 in foreign countries, and 1 over the Gulf of Mexico. Figure 26 shows the location of domestic accidents, and table 9 lists details about the accidents that occurred outside the United States.

DATA ACCIDENT CRAFT Ř  $\overline{\triangleleft}$ ц. 0 REVIEW **AUNN**  $\triangleleft$ 

Of the 57 aircraft involved in Part 121 accidents in 2000, 87.5% were conducting passenger flights. All of the passenger flights were scheduled, while six of the seven cargo-only accidents occurred during nonscheduled flights. After 1997, the proportion of Part 121 accidents associated with nonscheduled flights consistently ranged between 9.8% and 14.0% for all Part 121 accidents. This statistic is particularly notable because nonscheduled flights accounted for only 4.5% of all Part 121 flight hours and just 3.6% of Part 121 departures. Finally, as shown in table 10, most Part 121 accidents (89.3%) in 2000 were classified as either *injury* or *damage* (i.e., the two least-severe categories), a finding consistent with the years 1991 through 1999. In 2000, more than half of the accidents produced no injuries or only minor injuries.

In 2000, most (63.2%) Part 121 accidents involved aircraft with turbofan engines; 26.3% had turboprop engines; and 10.5%, turbojet engines. More than half of the aircraft were either substantially damaged or destroyed, but almost a third were undamaged (table 12).

Table 12

Phase of Flight and First Occurrences for Part 121 Operations.

Investigators use first occurrence data by phase of flight to describe the initiating event of an accident flight. In 2000, the first occurrences cited most often for Part 121 accidents were in-flight encounters with weather during cruise or descent (25.0%). Cruise and descent accounted for more than a third of all first occurrences, followed by approach or landing (22.0%). One of the approach or landing accidents involved an Embraer 120 hitting a deer on the runway. Table 13 shows first occurrence data by phase of flight for 51 of the aircraft involved in Part 121 accidents.

Interestingly, two of the phase-of-flight categories related to ground operations (standing and taxiing) together accounted for 25% of Part 121 accidents. Four of the accidents related to ground operations involved ground vehicles striking an aircraft, and four involved taxiing aircraft striking other objects (especially around the gate area). In two instances, jet blast caused injuries and damage: a Boeing 737 taxiing on a ramp blew over a Cessna 150, and a Boeing 767 pulling up to a gate knocked down a ramp serviceman.

ANNUAL REVIEW OF AIRCRAFT ACCIDENT DATA

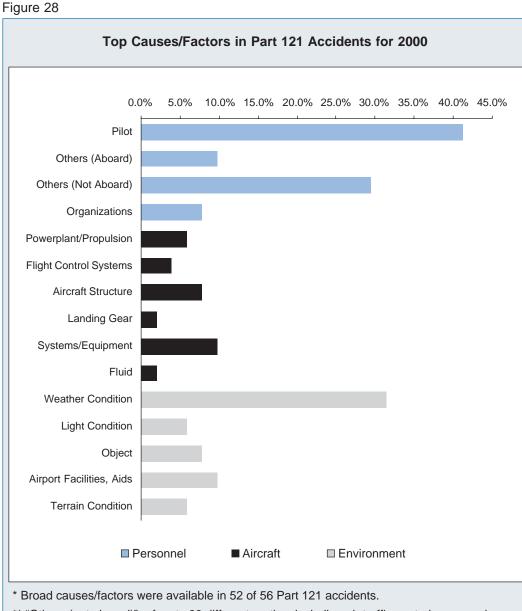

Figure 27 relates the severity of an accident to phase of flight for the first occurrence. As might be expected, takeoff/climb, cruise/descent, and approach/landing accidents resulted in the most severe injuries and damage, with cruise or descent accidents causing the most injuries. More than half the accidents involved only damage to the aircraft, with ground operations (standing and taxiing) accounting for 30% of the damage-only accidents.

DATA ACCIDENT RCRAFT  $\overline{\triangleleft}$ ШО REVIEW ANNUAL

Figure 28 summarizes causes/factors for Part 121 accidents in 2000, organized within the broad categories of personnel, environment, and aircraft. As this graph shows, pilots were the most frequently cited personnel (41.2%), but numerous accidents (29.4%) were attributed to people not aboard the aircraft, such as ground personnel, air traffic controllers, and manufacturer personnel. Weather conditions (31.4%) were the causes/factors cited most frequently in the environmental category. Airport facilities and navigation aids (9.8%) and objects such as birds or airport vehicles (7.8%) were the second and third most frequently cited environmental factors. The systems/equipment category was the aircraft cause/factor (9.8%) cited most often, with powerplant/propulsion cited in 5.9% of the accidents and aircraft structure in 7.8%.

\*\* "Others (not aboard)" refers to 33 different parties, including air traffic control personnel, manufacturers, ground personnel, and FAA personnel.

REVIEW

Aircraft structures and aircraft systems, two categories of aircraft-related causes and factors, have been singled out for special attention by the FAA's National Aging Aircraft Research Program (NAARP).<sup>32</sup> NAARP was prompted by the 1988 Aviation Safety Research Act<sup>33</sup> and was expanded in 1997 to include mechanical and electrical systems. Figure 29 shows the number of Part 121 accidents from 1991 to 2000 that were attributed to aircraft structures and to aircraft systems, and the total number attributed to aircraft-related causes/ factors.<sup>34</sup> Because any given accident may have multiple causes/factors, an accident may be attributed to both a structural failure or malfunction and a system failure or malfunction.

In 2000, six structure-related and seven systems-related accidents occurred among Part 121 aircraft. Those 13 accidents accounted for 81.2% of the Part 121 cause/factor citations that were aircraft-related, and 8 of the 12 accidents attributed to aircraft-related factors. As shown in figure 29, systems-related accidents typically occurred more frequently than structure-related accidents from 1991 to 2000, although the difference between the two categories was greater from 1996 through 1998 than in previous years.

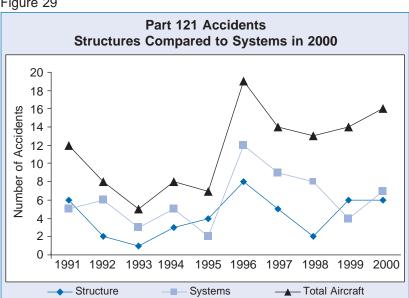

Figure 29

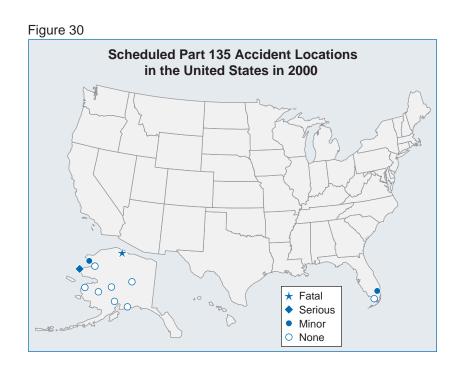

<sup>&</sup>lt;sup>32</sup> NAARP defines aircraft structures to include the hull, wings, vertical and horizontal stabilizers, flight control surfaces, and doors and windows. Aircraft systems include flight control systems, instruments, heating and air conditioning, all hydraulic systems including landing gear, and all electrical systems including wiring. <sup>33</sup> Initially, NAARP aimed to study fatigue and environmental degradation of aircraft structures. Over the years, the program has evolved to include engines and other aircraft systems in both Part 121 and Part 135 aircraft. <sup>34</sup> The graph was constructed by identifying the aircraft-related causes/factors that could be categorized as attributable to aircraft structures or to aircraft systems. This was done by using the detailed aircraft-related occurrence codes that identify the specific aircraft structure or system involved in the accident.

#### PART 135 ACCIDENTS IN 2000

As noted previously, Part 135 applies to commercial air carriers that can operate commuter flights (i.e., scheduled Part 135), air taxis (i.e., on-demand Part 135), and cargo flights (both scheduled and on-demand). Scheduled Part 135 operations consist of common-carriage, passenger-revenue flights for which the operator must offer the departure location, departure time, and arrival location in advance and must include five or more round trips per week between two or more points. In contrast, on-demand operations typically include flights for which the departure time, departure location, and arrival location are specifically negotiated with the customer. Of the 92 aircraft involved in Part 135 accidents in 2000, 12 were scheduled and 80 were on-demand.

All of the scheduled Part 135 accidents occurred in the United States, with 10 in Alaska and 2 in Florida, as shown in figure 30. The proportion of accidents in Alaska is large in part because over half of all scheduled Part 135 operators are certificated in Alaska, where the operating environment is challenging.<sup>35</sup>

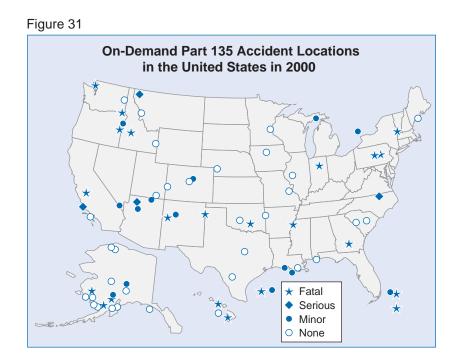

Of the 80 on-demand Part 135 accidents, 75 occurred in the United States, 3 in the Caribbean, and 2 over the Gulf of Mexico, as shown in figure 31. Of the 75 that occurred in the U.S., 18 occurred in Alaska and the rest were distributed among the other 49 states and Puerto Rico (including the Gulf of Mexico). For

41

<sup>&</sup>lt;sup>35</sup> National Transportation Safety Board, Aviation Safety in Alaska, NTSB/SS-95-03 (Washington, DC: NTSB, 1995).

on-demand Part 135 accidents, 53.8% were passenger flights, and 46.2% were cargo and/or mail flights. In both scheduled and on-demand Part 135 accidents, fewer than half resulted in injuries, as shown in table 14.

Tabl	e 1	4
------	-----	---

Part 135 Accidents Highest Injury by Schedule Type in 2000						
Scheduled On-Demand						
	Passenger Operations	Passenger Cargo/Mail				
Fatal	1	11	11	23		
Serious	1	4	1	6		
Minor	2	10	4	16		
None	8	18	21	47		
Total	12	43	37	92		

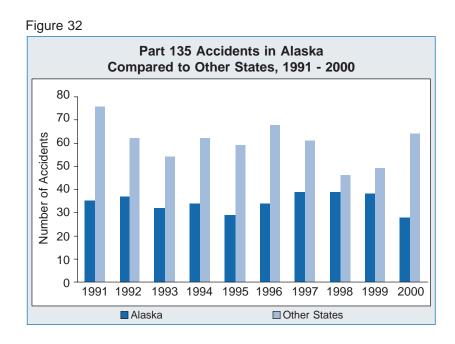

Part 135 flights can operate under two basic types of flight plans: visual flight rules (VFR) and instrument flight rules (IFR). VFR flights are defined by specific minimum weather conditions related to visibility, distance from clouds and cloud ceiling, and requirements for minimum fuel and cruising altitudes. IFR flights are defined by reference only to instruments and are subject to specific limits imposed by published procedures and weather conditions. An IFR flight plan allows flying in weather conditions that do not meet the minimum specified by VFR. For scheduled Part 135 accidents in 2000, nine had filed VFR flight plans,

and one of the remaining three had filed no flight plan (table 15). For ondemand flights, 55% of the accident flights were flown under VFR flight plans and 38.8% under IFR flight plans. In 6.2% of the on-demand accidents, the flight plan was unknown or there was no flight plan.

Table 15						
Part 135 Accidents by Schedule Type and Flight Plan for 2000						
Scheduled On-Demand Tota						
Visual Flight Rules (VFR)	9	44	53			
Instrument Flight Rules (IFR)	2	31	33			
Unknown or None	1	5	6			
Total	12	80	92			

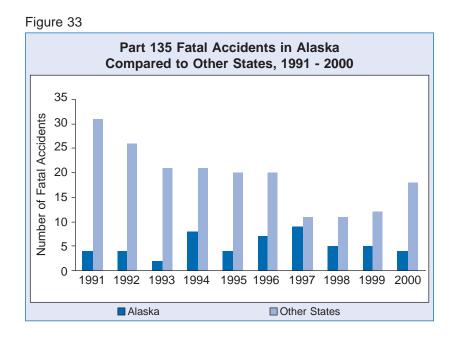

**On-Demand Part 135 Operations in Alaska.** Throughout the period, Alaska consistently accounted for a significant proportion of all Part 135 accidents. As shown in figure 32, 30% to 45% of all Part 135 accidents in the 10-year period occurred in Alaska. In 2000, 28 Part 135 accidents (30.4% of the total) occurred in Alaska. Of those 28, 18 were on-demand (22.5% of the total number of accidents among on-demand flights), and 10 were scheduled (83.3% of the total number of accidents among scheduled flights). In comparison, Arizona and Hawaii had the second-highest number of Part 135 accidents at five each, all operating as on-demand Part 135.

43

Despite the large proportion of Part 135 accidents that occurred in Alaska, the number of fatal Part 135 accidents in Alaska remained low, especially when compared to other U.S. states (figure 33). The proportion of fatal accidents ranged from a low of 8.7% in 1993, to a high of 45.0% in 1997. In recent years, the number of fatal accidents in Alaska remained relatively constant, while the total number of Part 135 fatal accidents in other states increased.

Accident rates for Alaska are difficult to determine because of the way in which Part 135 flight hours are calculated. However, almost all scheduled Part 135 operations occur in Alaska; consequently, the overall rate of 32.5 accidents per million flight hours may be a reasonable estimate of the accident rate in Alaska for 2000. This rate is more than 10 times greater than the Part 121 accident rate and 1.4 times greater than the on-demand Part 135 accident rate.

The on-demand Part 135 accident rate in Alaska is more difficult to determine. As previously discussed, on-demand Part 135 flight hours are taken from the *GAATA Survey*, which does not partition estimated flight hours for on-demand operations by state or region. Consequently, flight hours for on-demand Part 135 operations in Alaska cannot be obtained.

#### DETAILED ANALYSIS OF SCHEDULED PART 135 ACCIDENTS FOR 2000

In 2000, approach or landing accounted for half of all scheduled Part 135 accidents, with the initiating event distributed almost uniformly among first occurrences (table 16). No accidents were attributed to ground operations (that is, standing or taxiing). Cruise or descent accidents were mostly (3 of 4) related to in-flight collision with an object (all bird strikes). Airframe, component, or system failure occurred in all phases of flight not associated with ground operations and was the second-most-frequently cited first occurrence.

#### Table 16

Scheduled Part 135 First Occurrences by Phase of Flight for 2000							
	Takeoff or Climb	Cruise or Descent	Approach or Landing	Total			
In-flight Collision with Object		3	1	4			
Airframe, Component, System Failure	1	1	1	3			
Dragged Wing, Rotor, Pod, Float, or Tail/Skic	ł		1	1			
In-flight Collision with Terrain or Water			1	1			
In-flight Encounter with Weather			1	1			
On-surface Encounter with Terrain or Water	1			1			
Undershoot			1	1			
Total Accidents	2	4	6	12			

As shown in figure 34, approach or landing accidents resulted in the greatest number of injuries (including all fatal and serious injuries) while none of the cruise or descent accidents resulted in injuries. Three of the accidents that occurred during cruise or descent were bird strikes, and the fourth occurred when a mud flap separated from the left main landing gear and struck the horizontal stabilizer.

The pilot was identified as the primary cause/factor in the largest proportion of scheduled Part 135 accidents (50.0%), with a number of important environmental factors cited as major contributors (figure 35). Objects accounted for the greatest proportion of environmental factors (33.3%), with terrain and airport facilities each cited 25.0% of the time. The most frequently cited aircraft cause/factor in the accidents was the landing gear (16.7%).

# AIRCRAFT ACCIDENT DATA Ш О REVIEW ANNUA

Of the 21 people who were injured in scheduled Part 135 accidents in 2000, five suffered fatal injuries (table 17). All of the fatalities and five of the seven serious injuries were due to a single accident in Nuiqsut, Alaska, when a twinengine Piper PA-31T3 crashed during an aborted landing. The difference in accident frequency between aircraft with reciprocating engines and aircraft with turboprop engines was small (table 18).

#### DETAILED ANALYSIS OF ON-DEMAND PART 135 ACCIDENTS FOR 2000

On-demand Part 135 operations provide charter and air taxi service to customers. In 2000, airplanes accounted for 63 of the 80 aircraft involved in on-demand Part 135 accidents, and the remaining 17 were helicopters. This section provides more detailed analysis of on-demand Part 135 airplane and helicopter accidents. EVIE

 $\leq$ 

OF AIRC

RAF

T ACCIDENT

ATA

The approach or landing phase of flight accounted for the greatest number of on-demand Part 135 airplane accidents in 2000, followed by cruise or descent and takeoff or landing (table 19). This pattern was distinctly different for helicopter accidents, which occurred most often during cruise or descent (table 20). Inflight encounter with weather was the first occurrence most frequently cited during cruise or descent for both airplanes and helicopters. In-flight encounter with weather was also a factor for airplanes during approach or landing, but not for helicopters. This may be due, in part, to the capability of helicopters to hover and maneuver at slow speeds at much lower altitudes. Loss of control while in flight was, however, the most frequently cited first occurrence for helicopters during takeoff, climb, approach, landing, and maneuvering or hovering. Only four of the airplane accidents and none of the helicopter accidents occurred during the taxiing or standing phase, in contrast to the Part 121 first occurrence data in which 25% of the accidents occurred during those two phases of flight.

On-demand Part 135 accidents resulting in the most fatalities for both airplanes and helicopters occurred during cruise or descent (figures 36 and 37). Because helicopters can hover and slowly depart and approach landing areas, fewer helicopter accidents occur during takeoff and climb or approach and landing and injuries resulting from the accidents that do occur are less serious.

DATA AIRCRAFT ACCIDENT ШО REVIEW ANNUAL

For both on-demand Part 135 airplane and helicopter accidents, the pilot was the most frequently cited cause/factor, followed by terrain and weather conditions (table 21). Powerplant/propulsion factors, were cited as often for helicopters as weather. Note that powerplant and propulsion factors were cited much more frequently for helicopters (35.3%) than for airplanes (16.9%); in both cases, these factors were cited more frequently than in Part 121 accidents (only 6.0%).

Table 21

Total	47	17	14	1	1	80						

Among the 80 on-demand Part 135 accidents that occurred in 2000 (table 23), 22 resulted in 71 fatalities, but almost half of the fatalities (30) resulted from two accidents.

- On May 21, a British Aerospace J-3101 crashed on approach to Wilkes-Barre/Scranton International Airport after losing both engines due to fuel exhaustion and starvation, resulting in 19 fatalities.
- On August 9, a chartered Piper PA-31 Navajo Chieftain and a Piper PA-44-180 Seminole collided over Burlington Township, New Jersey, resulting in 11 fatalities.

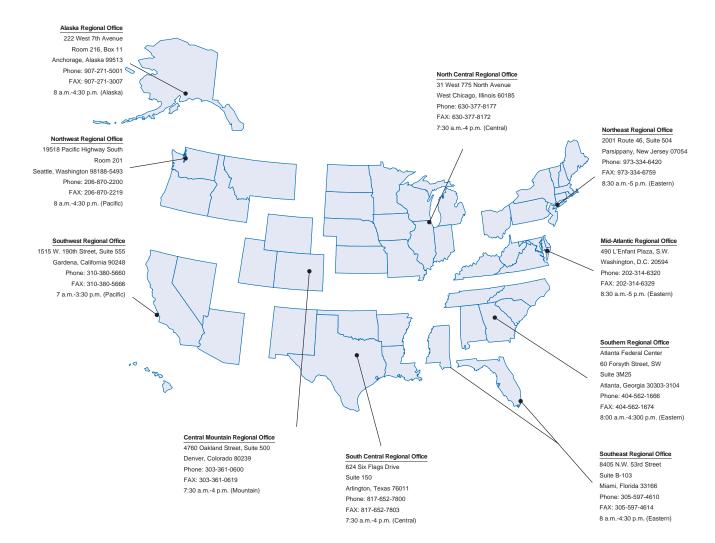

In addition to these fatalities, accidents among on-demand Part 135 operations accounted for 12 serious and 44 minor injuries. Of the 141 passengers involved in on-demand Part 135 accidents, 51% received injuries.
